**Items not included**

- Computer (laptop recommended) running Microsoft Windows. Your computer needs: one available serial port, or USB port, one available Ethernet port (Recommended 100 mbs network card or higher), and a DVD/CD drive.
- (Recommended)Gigabyte Hub/Switch
- UPS Battery Backup
**Introduction**

In this quick start guide, you will learn how to set up and configure the IdentiLynx camera with your FinishLynx Timing system and playback full frame video captured at the finish line.

**IMPORTANT NOTE:** Lynx recommends a Gigabyte hub/switch and Gigabyte network card as a minimum when adding the IdentiLynx camera to your timing system.

**Step 1: Install the Latest FinishLynx Software**

a) IdentiLynx requires the latest version of FinishLynx

b) Open FinishLynx on your computer — go to Help | About and write down your FinishLynx Serial Number if you do not have it stored somewhere. Also record the serial numbers for any FinishLynx Software Plug-Ins

c) If accessible, insert the supplied Lynx Flash Drive into your computer's USB port and install FinishLynx. Or download the latest version from the website: www.finishlynx.com/product/software/finishlynx-results-software/

d) Enter the serial number found on your Lynx flash drive or from your Help|About information.

e) Open FinishLynx, click Help|About and verify a serial number is listed next to FinishLynx (this verifies installation was successful)

**Step 2: Set-Up IdentiLynx Camera**

a) Place the camera on the tripod, about chest high and in a safe location aimed at the finish line facing in the direction of the oncoming runners.

b) Plug the Power over Ethernet power supply into the power source or UPS battery backup.

c) Connect the first Ethernet cable (10') from the Hub/UPS battery backup.

d) Connect a second Ethernet cable (100') to the "Out" port on the IdentiLynx power supply.

e) Do not connect the other end of the second Ethernet cable to the RG45 port on the back of the IdentiLynx Camera until FinishLynx is ready to boot the cameras.

**NOTE:** The IdentiLynx camera gets Power over Ethernet (POE)
Step 3: Boot Cameras

a) Open the FinishLynx program.
b) Power on the FinishLynx cameras first, before the Identilynx camera, a single camera at a time.
c) After ALL your regular FinishLynx cameras have started and appeared in the camera listing in the FinishLynx Hardware Control window, plug in the Ethernet cable from the “Connect” port on the power injector to the RG45 port on the back of the Identilynx camera.
d) Verify that the Identilynx camera boots with the default settings:

XS: Rate - 5 fps, Density - 480, and Mode - 100%
XR: Rate - 5 fps, Density - 720, and Mode - 100%

NOTE: If the Identilynx camera goes off-line due to loss of power or network connection the camera name does not turn RED as the FinishLynx camera. The software does not do a check to see if the Identilynx camera is connected.

NOTE: Booting the Identilynx camera at the end of the order will eliminate any interruption in camera communication if you turn off or lose connection with the Identilynx camera at some point and require re-booting the FinishLynx cameras (IP order of assigning).

Step 4: Align Identilynx Camera

The Identilynx camera is a Full Frame Video so the image during alignment mode will be a normal two dimensional video in the Image Zone.

a. Follow Steps 1, 2, and 3 above.
b. Confirm that the Identilynx camera has booted-appears in the listing in the Hardware Control window.
c. Have someone stand on the finish line to determine the focus point.
d. Select the Identilynx camera in the Hardware Control window and click on the Red Stop sign to put the Identilynx camera into Alignment mode.
e. Adjust the Identilynx camera to the desired zoom and focus to capture video at the Finish Line.

Step 5: Camera Settings

NOTE: Only the Setup, Parameters and Capture tabs will apply to settings for the Identilynx camera. The other settings are grayed out as they do not apply to the Identilynx functions.

a) Click on the Camera Settings Icon (blue circle with white “I”)
b) Click on the Setup Tab and Name the camera based on location or function

c) Click on the Parameters tab and set the Frame Rate and Density to your desired need. If you see any problems with image capture, lower the frame rate, and/or return the Pixel Mode to Wide 50%.
d) Click on the Capture Tab and make sure Manual is selected. Make sure that the Capture Button is configured correctly in File|Options|General if you are using ACM on the FinishLynx cameras

e) In File | Options | Image, make sure that Time Tracking is set to “All Cameras”
Step 6: IdentiLynx Image Tool

a) Open a New Blank Event in FinishLynx
b) Get a start for the system and have someone run through the Finish Line as you capture (All Cameras)
c) Click on the “+” and “-” icons on the Image Tool Bar and zoom in and out of the image
d) Click on the Full Screen icon to show the image full screen
e) The Cropping tools and Find Next Object are not applicable to the IdentiLynx image
f) Right click and hold in the IdentiLynx image and drag to draw a small box and choose enhance from the menu when the mouse is released. Click on the Restore Image icon to bring it back to the original state

Step 7: Time Tracking With IdentiLynx

NOTE: The Red hash line does not appear on the IdentiLynx image unless you click on the image frame. Time can NOT be read from the IdentiLynx image

a) Using the same Blank Event, investigate the time tracking between the FinishLynx camera and IdentiLynx.
b) Click on a competitor in the Finish Lynx image and the IdentiLynx image should jump to that Frame (time reference) in the sequence
c) Click on the Play button for the IdentiLynx images and then click in the FinishLynx image. The IdentiLynx image will jump to that location and continue to play from that point forward.

Step 8: Remote Focus Fine Tuning

The remote focus adjustment on the IdentiLynx PRO cameras is for FINE TUNING ONLY. You will need to get the image approximately in focus manually, and then use the controls in the Hardware Control window to bring the image into precise focus.

Major adjustments in focus are NOT possible from within the FinishLynx software.

Note (a): When adding IdentiLynx PRO cameras to your network, be sure to monitor Ethernet traffic and watch for congestion. Add one camera at a time, and increase the resolution, or frame rate in increments. We recommend the use of a Gigabyte Network Switch. Use the same methodology when adding a second IdentiLynx camera to your FinishLynx network. From a results production standpoint, it is seldom necessary to go over 10fps in Cross Country or Road Races

Note (b): The Play speeds are not displayed in the image tool bar. If you “Ctrl click” the buttons you’ll go to the first or last frame. If you “Shift click” the play button, the image playback will loop back to the beginning when the end is reached.

This completes the FinishLynx “IDENTILYNX PRO” Full Frame Video Capture System - Quick Start Guide.
